NUMBER OF PACKETS PER PRODUCT

The chart below provides information on the compatibility of various cementitious products with different types of concrete modifiers. This chart lists different cementitious products in the leftmost column and the types of modifiers in the subsequent columns. The cells in the table indicate whether a particular cementitious product is compatible with a specific modifier.

The check mark "✓" in a cell indicates compatibility, while "N/R" *(Not Recommended)* indicates that the combination is not recommended. This chart can be used as a reference guide to determine which modifiers can be used with different cementitious products. It is important to note that the addition of any modifier will alter the physical properties of the product, and it is recommended to conduct a mock-up or test to ensure the dosages used are suitable for the intended application.

The information contained in this document is made without guarantee or warranty, express or implied, regarding the suitability for use, merchantability, or performance of the formulation and its ingredients in any application.

It is the sole responsibility of the user of this information to determine the validity, applicability, and performance of the information, formulations, and claims prior to commercialization, use, and application thereof. The addition of any Concrete Modifier will alter the product's physical properties. Performance will differ based on, but not limited to, the following: the product selected, water quantity, water and ambient temperature, substrate conditions, application thickness, mixing and application procedures. CTS Cement recommends conducting a mock-up to ensure the dosages used are suitable for the intended application.
